Topic list

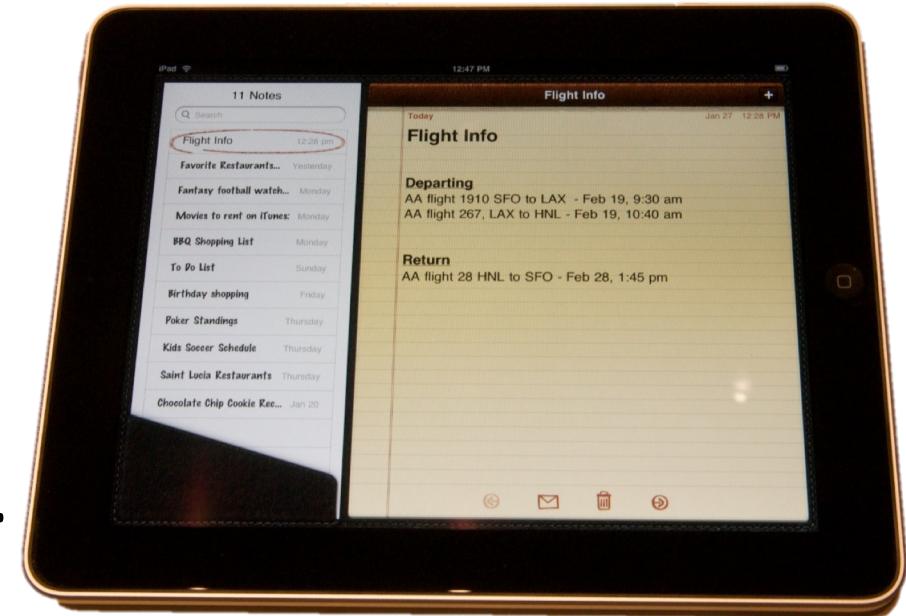

- 1. Grouping Objects**
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 - 2. Indexing within Collections**
 - Retrieval and removal of objects
 - 3. Generic classes**
 - e.g. **ArrayList**
 - 4. Iteration**
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

The requirement to group objects

- Many applications involve **collections** of objects:
 - Personal organizers.
 - Library catalogs.
 - Student-record system.
- The **number of items** to be stored varies:
 - Items added.
 - Items deleted.

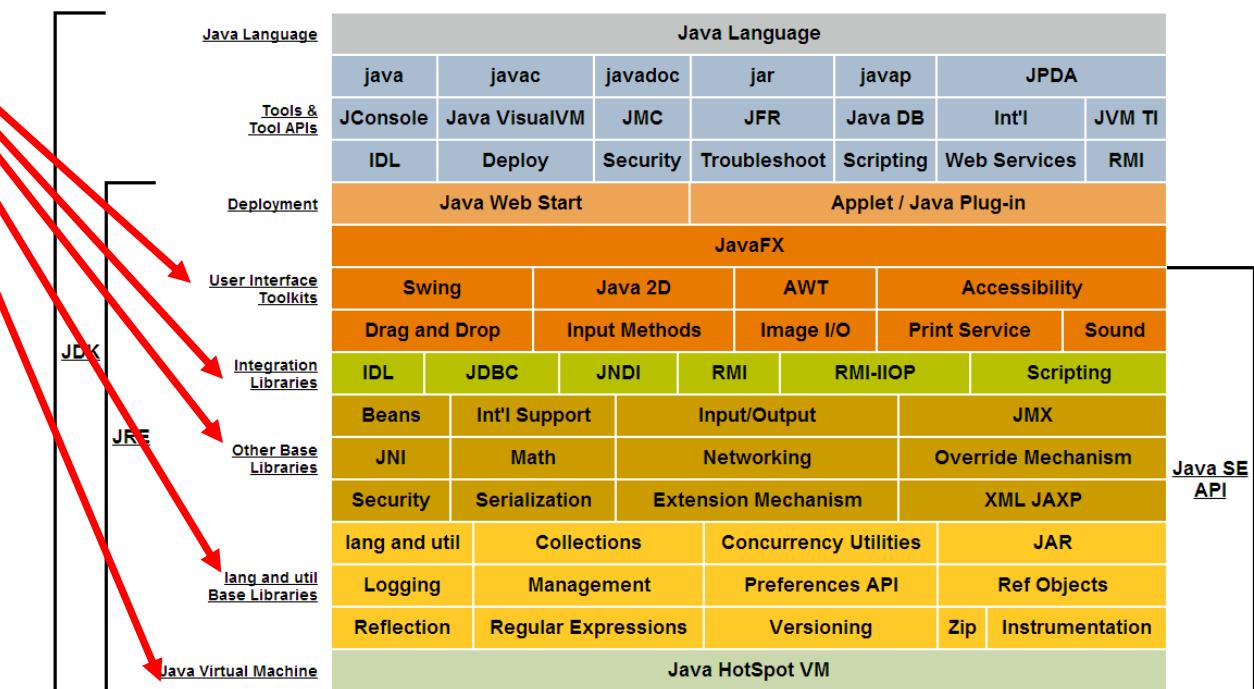

Example: A personal notebook

- Notes may be **stored**.
- Individual notes can be **viewed**.
- There is **no limit** to the number of notes.
- It generally **tells you how many** notes are stored.

Java API: the class library

- Many useful classes.
- We don't have to write everything from scratch.
- Java calls its libraries, ***packages***.
- *Packages contain individual classes*

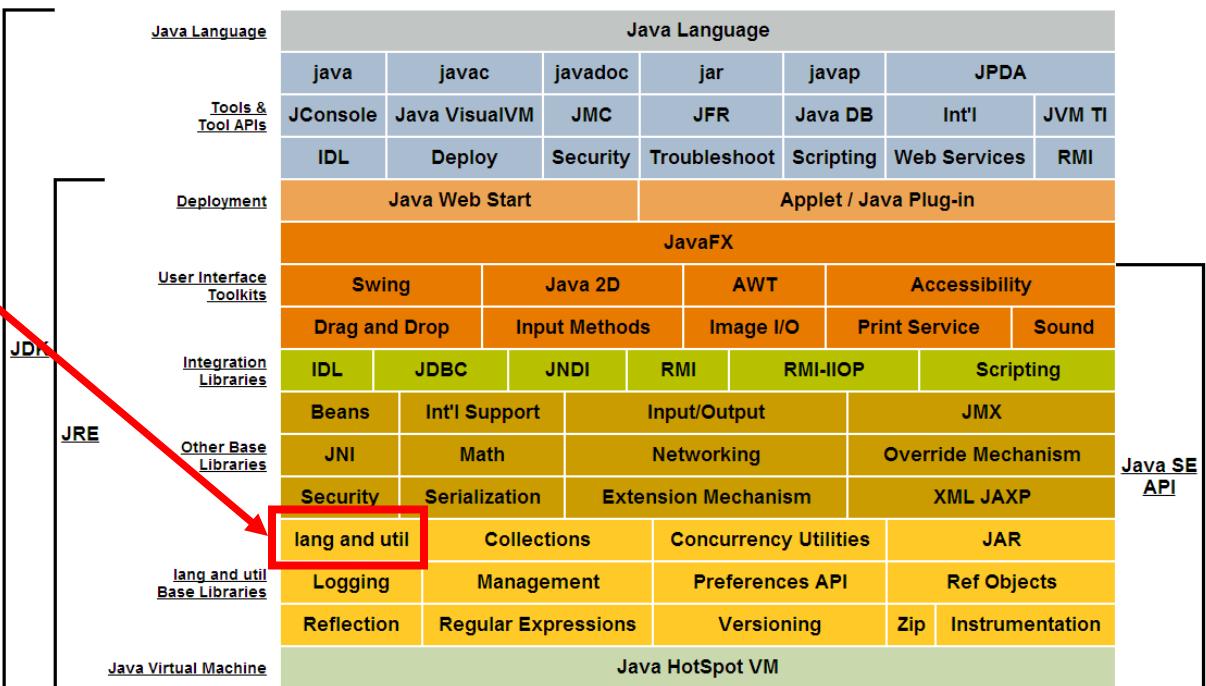

Java API: the class library

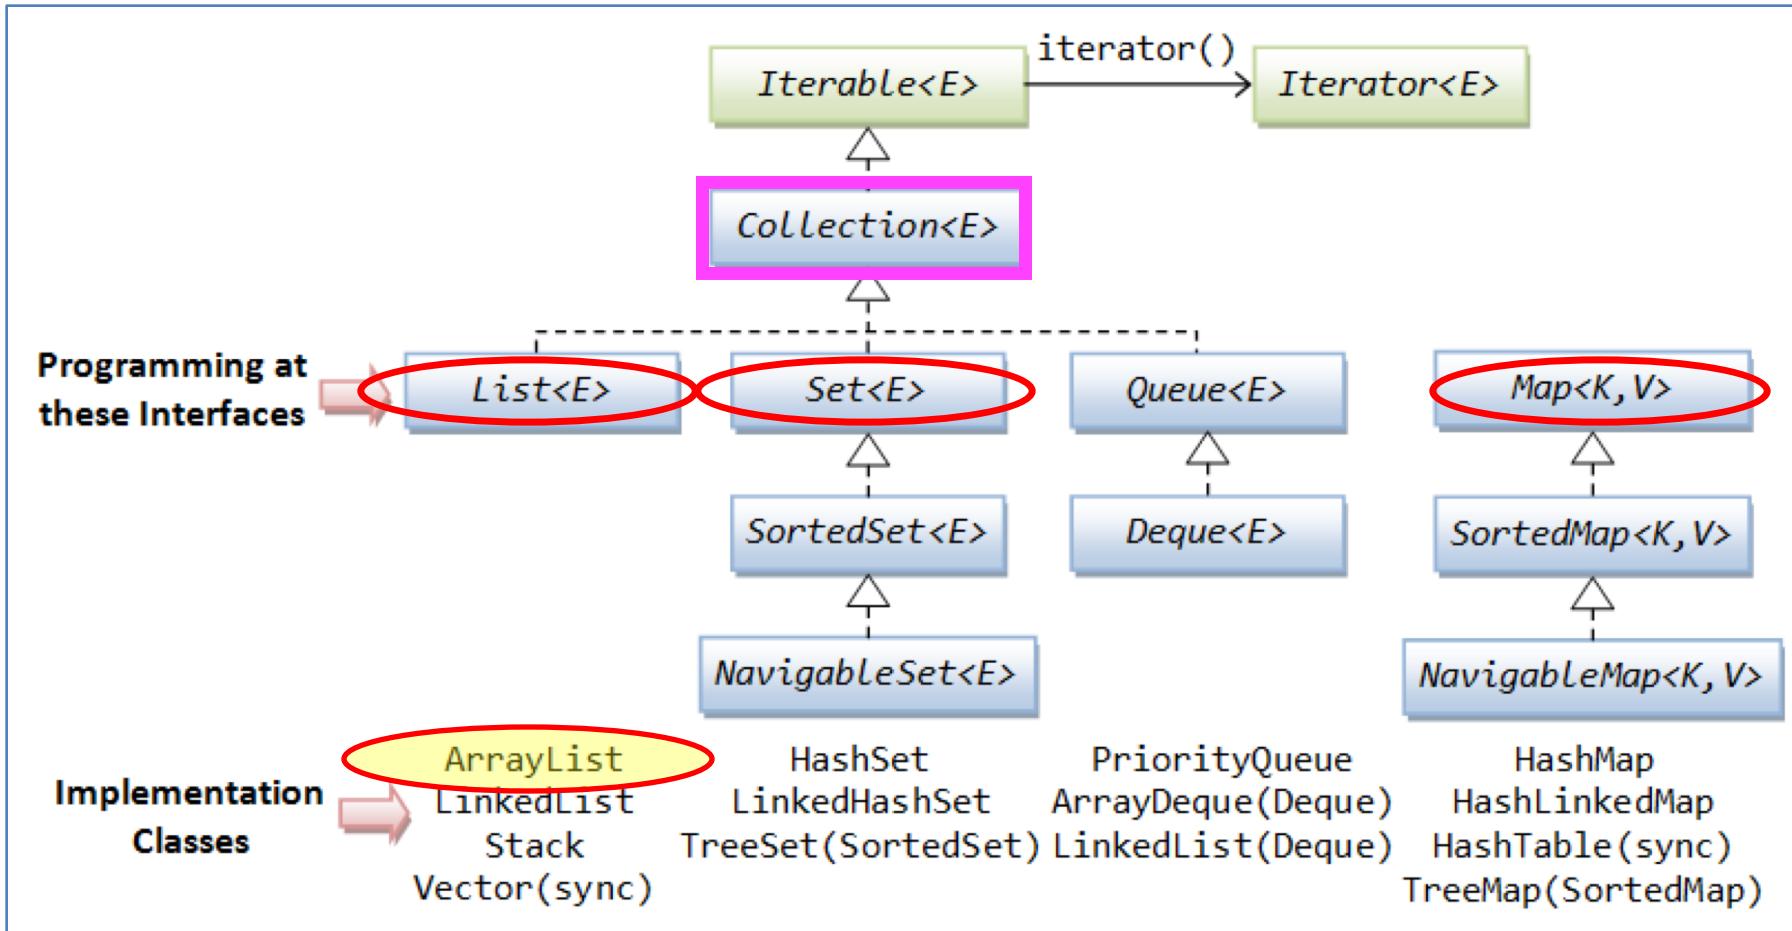

Back to the notebook:

- Grouping objects is a recurring requirement.
 - The `java.util` package contains classes for doing this

...the **Collections Framework**.

Java's Collections Framework

ArrayList Collection

- We specify:
 - the **type of collection**
 - e.g.: **ArrayList**
 - the **type of objects** it will contain
 - e.g.: **<String>**
- We say
 - “**ArrayList of String**”

```
import java.util.ArrayList;
```

import the ArrayList package

```
public class Notebook  
{
```

```
// Storage for an arbitrary number of notes.
```

```
private ArrayList <String> notes;
```

declares *notes* as a private “ArrayList of <String>”

```
// Perform any initialization required for the notebook.
```

```
public Notebook()
```

```
{
```

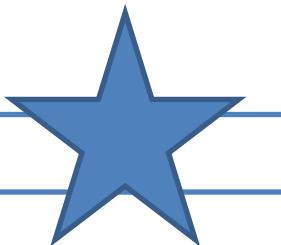

```
    notes = new ArrayList <String>();
```

```
}
```

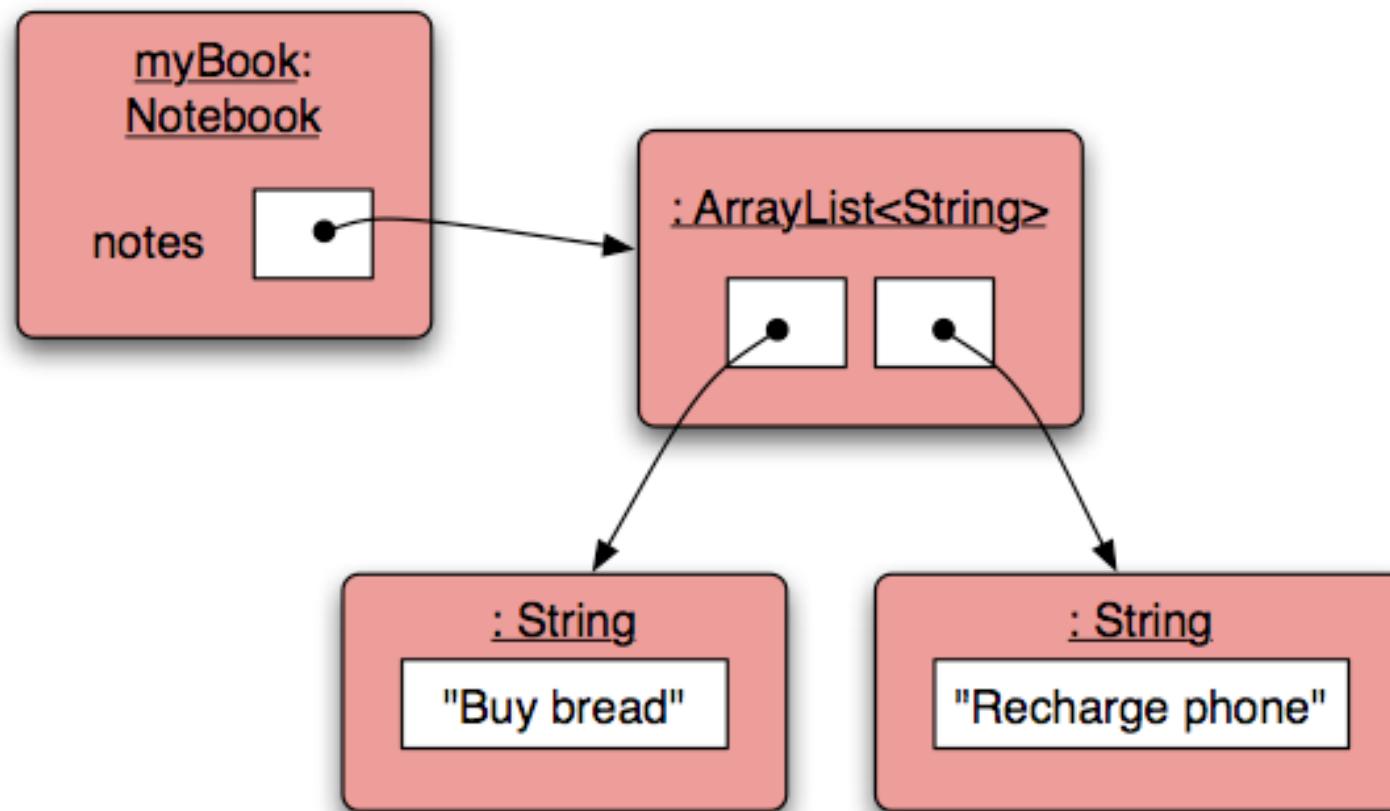

notes is initialised by calling the constructor using **new**

Note: **new** and **()**

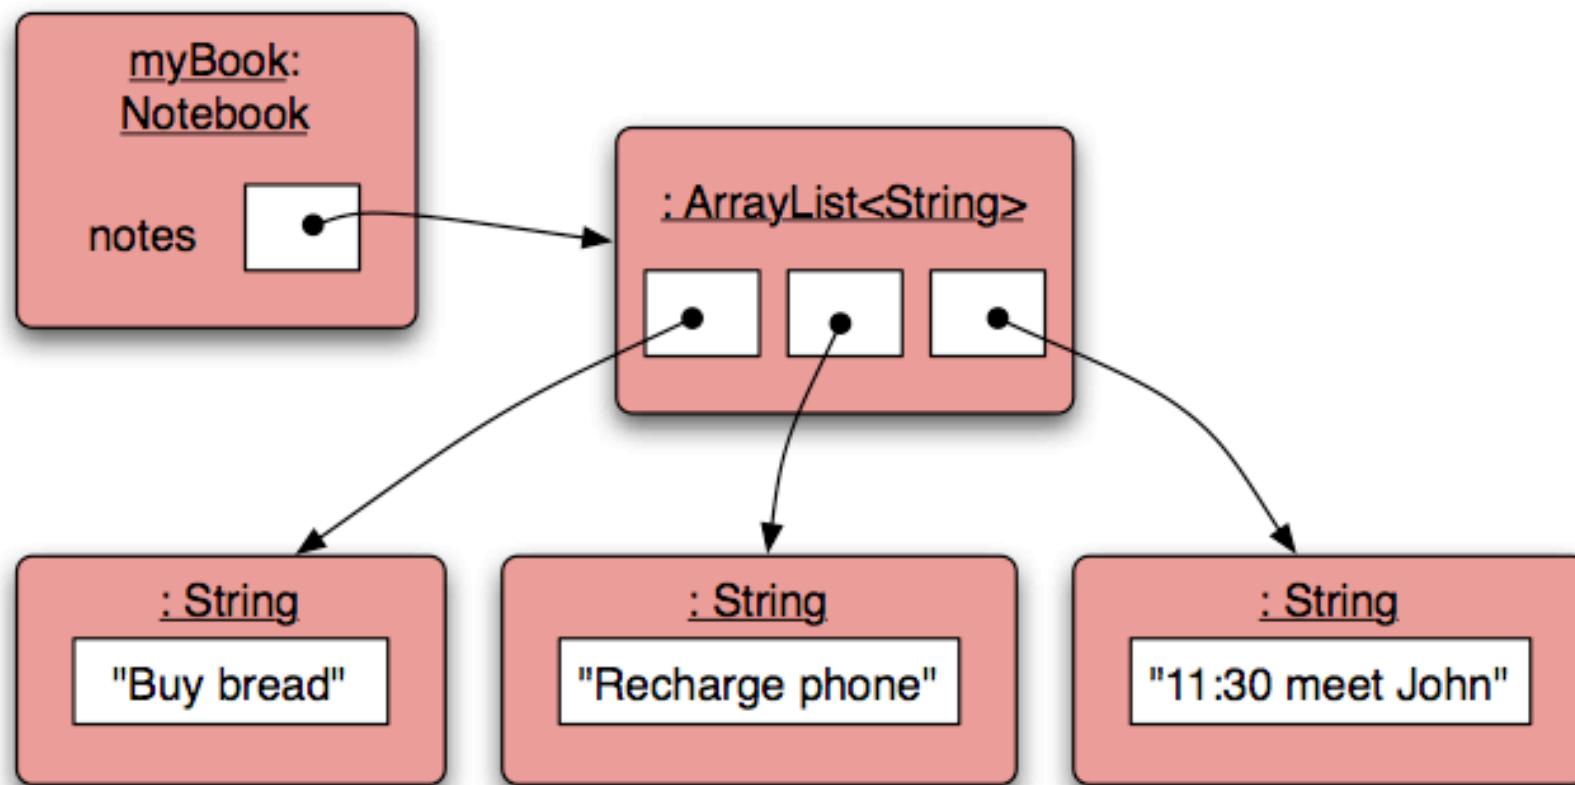

```
}
```

Object structures with ArrayList

Adding a third note

Features of the ArrayList Collection

- It increases its capacity as necessary.
- It keeps a private count
 - `size()` accessor.
- It keeps the objects in order.

Details of how all this is done are hidden.

- Does that matter?
- Does not knowing how, prevent us from using it?

```
import java.util.ArrayList;

public class Notebook
{
    private ArrayList <String> notes;

    public Notebook(){
        notes = new ArrayList <String> ();
    }

    public void storeNote(String note){
        notes.add(note);
    }

    public int numberOfNotes(){
        return notes.size();
    }
}
```

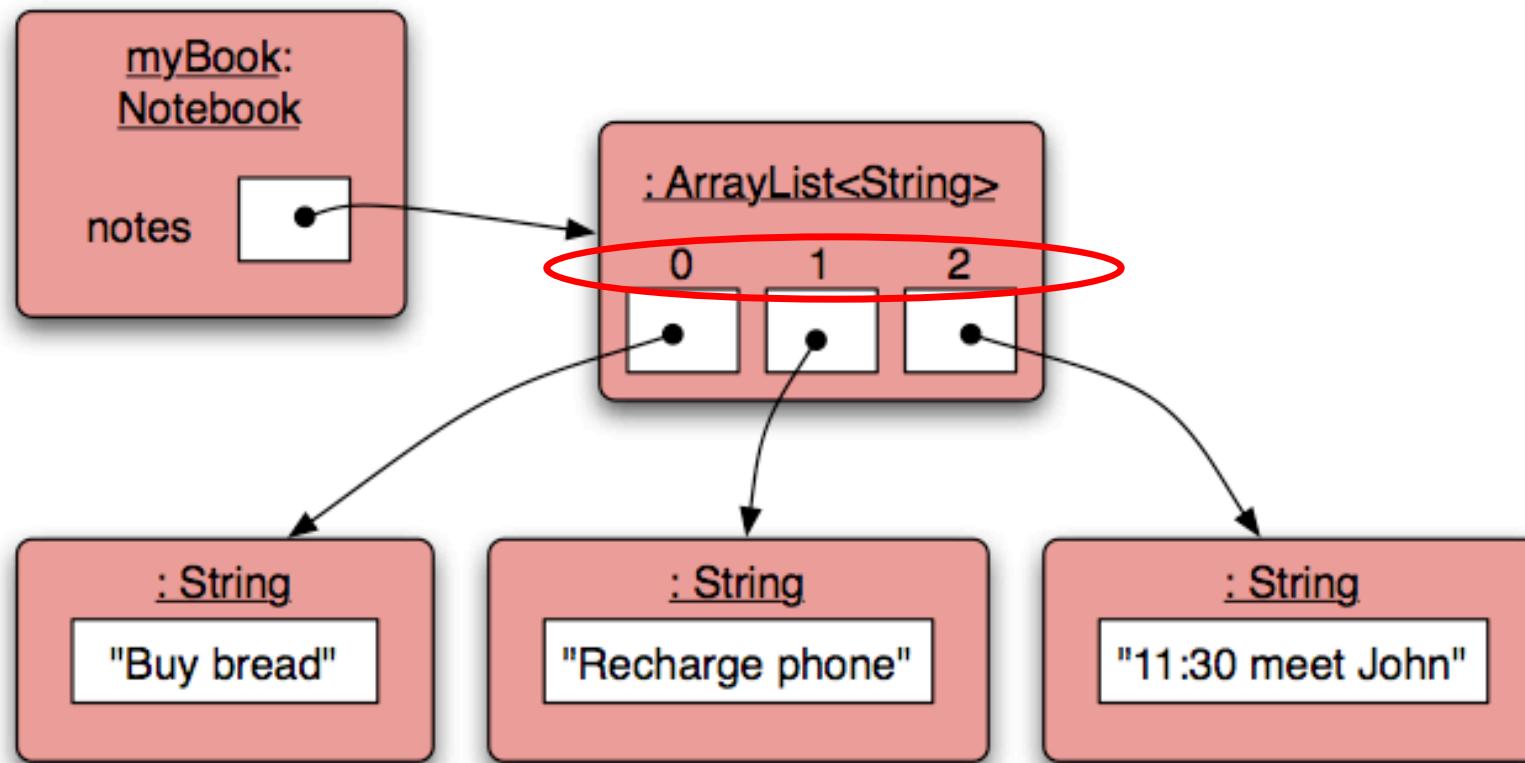

Adding a new note
of type String

Returning the
number of notes

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

ArrayList: Index numbering

Retrieving an object – `showNote()`

```
public void showNote (int noteNumber)
{
    if(noteNumber < 0) {
        // This is not a valid note number.
    }
    else if(noteNumber < numberOfNotes()) {
        System.out.println(notes.get(noteNumber));
    }
    else {
        // This is not a valid note number.
    }
}
```

Index validity checks

Retrieve and print the note

The diagram illustrates the control flow of the `showNote()` method. A blue rounded rectangle labeled "Index validity checks" contains three arrows pointing to the corresponding code blocks: the first arrow points to the first `if` statement, the second to the `else if` statement, and the third to the `else` statement. A red rounded rectangle labeled "Retrieve and print the note" contains a single red arrow pointing to the `System.out.println(notes.get(noteNumber));` line.

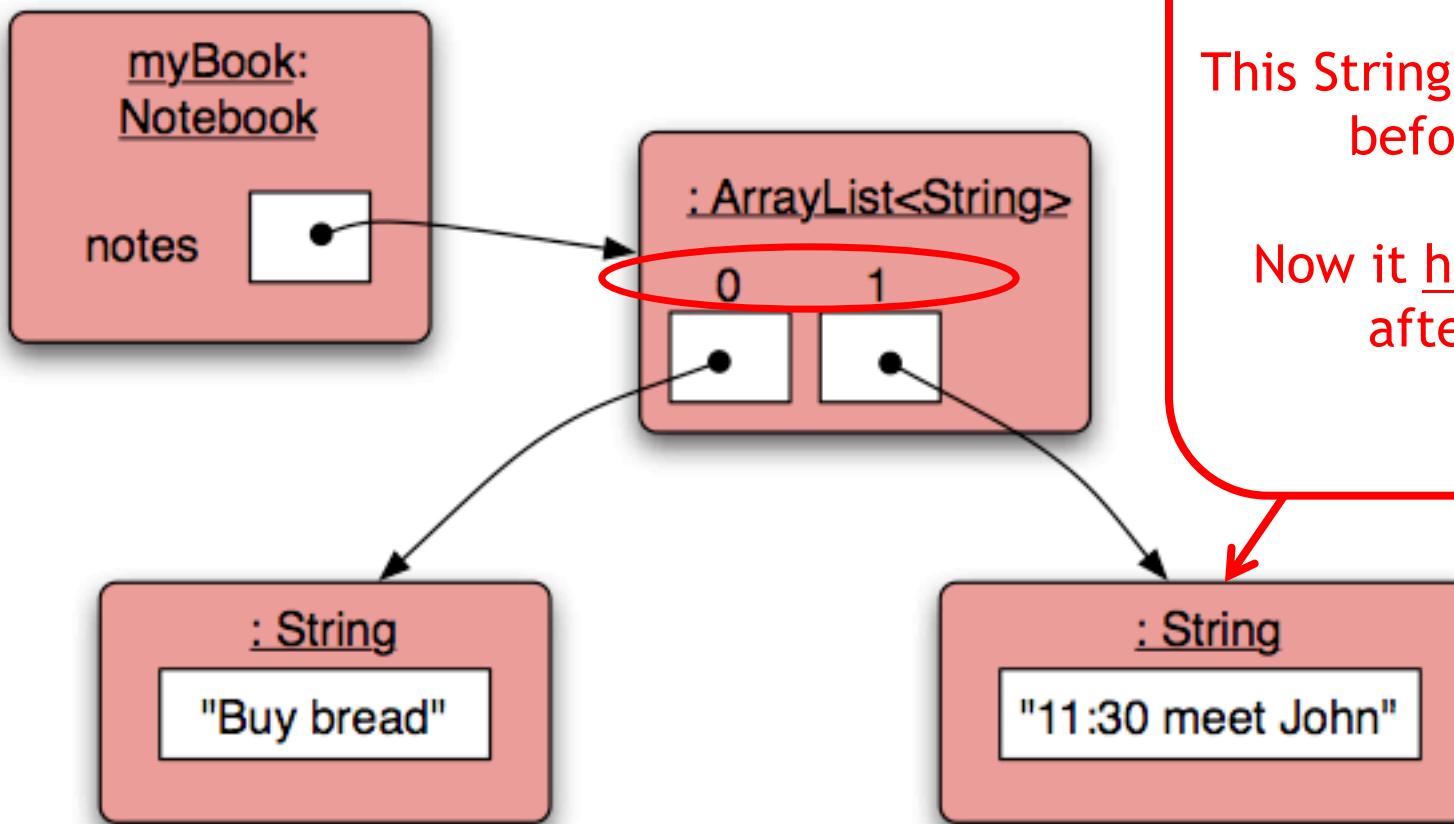

Removing an object

```
public void removeNote(int noteNumber)
{
    if(noteNumber < 0) {
        // This is not a valid note number, so do nothing.
    }
    else if(noteNumber < numberOfNotes()) {
        // This is a valid note number.
        notes.remove(noteNumber);
    }
    else {
        // This is not a valid note number, so do nothing.
    }
}
```

Index validity checks

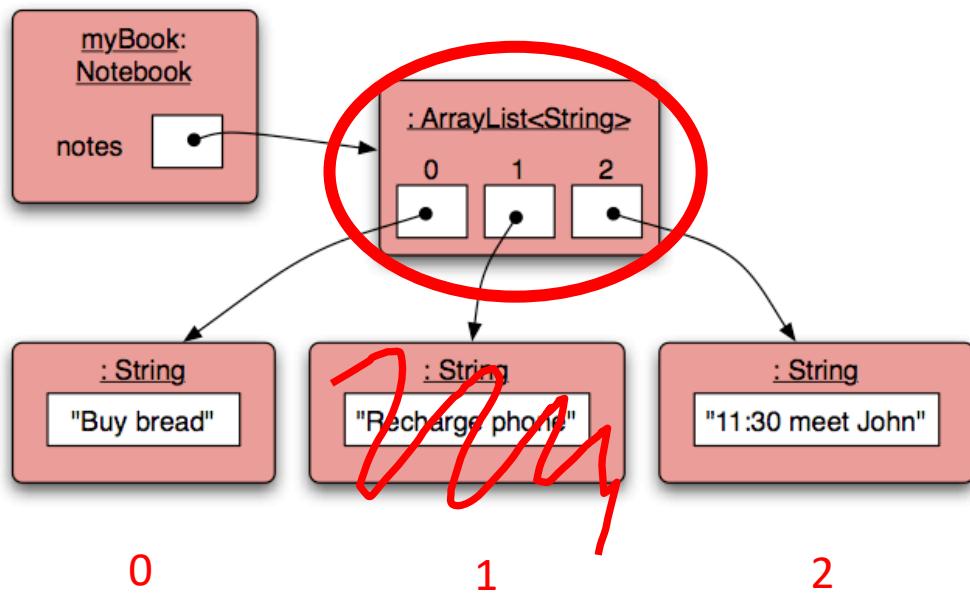

Delete the note at the specific index

Removal may affect numbering

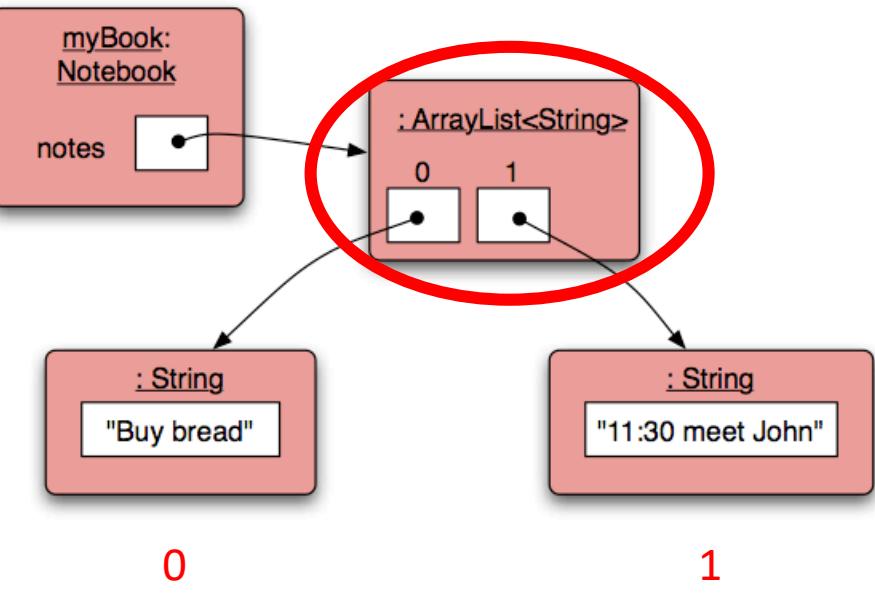

Removal may affect numbering

BEFORE

AFTER

NOTE the change in index numbering

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic / Parameterized classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

Generic/Parameterized Classes

OVERVIEW PACKAGE CLASS USE TREE DEPRECAT

PREV CLASS NEXT CLASS FRAMES NO FRAMES

SUMMARY: NESTED | FIELD | CONSTR | METHOD DETAILED

compact1, compact2, compact3
java.util

Class ArrayList<E>

java.lang.Object
java.util.AbstractCollection<E>
java.util.AbstractList<E>
java.util.ArrayList<E>

Collections are known as *parameterized* or *generic* types.

Note <E> is the parameter.

E gets replaced with some Class or Type

OVERVIEW PACKAGE CLASS USE TREE

Class String

java.lang.Object
java.lang.String

String is not parameterized.

OVERVIEW PACKAGE CLASS USE TREE

PREV CLASS NEXT CLASS FRAMES

SUMMARY: NESTED | FIELD | CONSTR | METHODS

compact1, compact2, compact3
java.util

Class ArrayList<E>

java.lang.Object
java.util.AbstractCollection<E>
java.util.AbstractList<E>
java.util.ArrayList<E>

ArrayList is parameterized.

The **type parameter <E>**
says what we want a list of e.g.:

ArrayList<Person>
ArrayList<TicketMachine>
ArrayList<String>
etc.

Generic/Parameterized classes

- **ArrayList** implements list functionality:

`boolean`

add(E e)

Appends the specified element to the end of this list.

`void`

clear()

Removes all of the elements from this list.

`E`

get(int index)

Returns the element at the specified position in this list.

`E`

remove(int index)

Removes the element at the specified position in this list.

`int`

size()

Returns the number of elements in this list.

ArrayList

size

add

remove

clear

get

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

Processing a whole collection (**iteration**)

- We often want to perform some actions an **arbitrary** number of times.
 - E.g.,
 - Print all the notes in the notebook.
 - How many are there?
 - Does the amount of notes in our notebook vary?
- Most programming languages include ***loop statements*** to make this possible.
- **Loops** enable us to **control how many times we repeat** certain actions.

Loops in Programming

- There are three types of standard loops in (Java) programming:
 - **while**
 - **for**
 - **do while**
- You typically use **for** and **while** loops to iterate over your **ArrayList** collection,

OR

- you can use another special construct associated with Collections:
 - **for each**

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

Recap: **for** loop pseudo-code

General form of a for loop

```
for(initialization; boolean condition; post-body action)
{
    statements to be repeated
}
```

Recap: for loop syntax

```
for(int i = 0; i < 4; i++)
```

for(*initialization*; *boolean condition*; *post-body action*)
{
 statements to be repeated
}

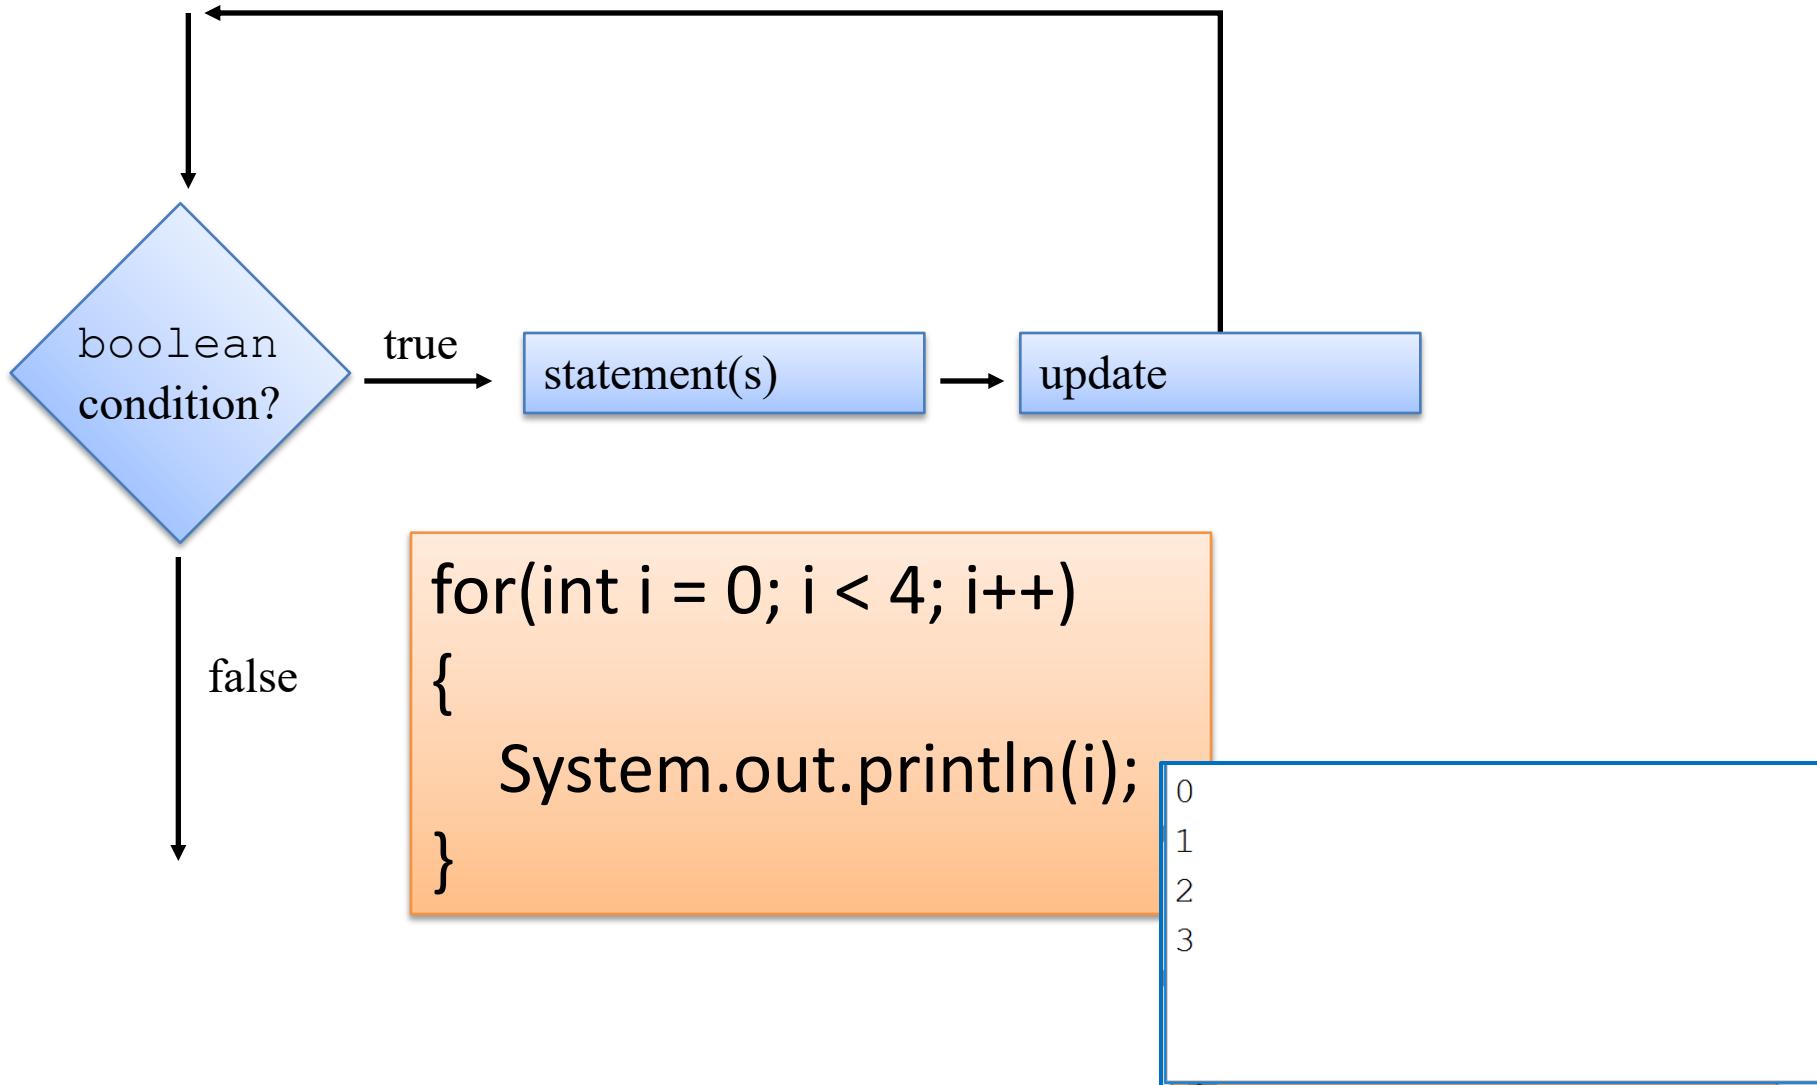

The diagram illustrates the structure of a for loop. At the top, a line of code is shown: `for(int i = 0; i < 4; i++)`. Below it, the general syntax is given: `for(initialization; boolean condition; post-body action)`. Three arrows point from the specific code to the corresponding parts of the general syntax: a red arrow points to the initialization part (`i = 0`), a green arrow points to the boolean condition part (`i < 4`), and a blue arrow points to the post-body action part (`i++`).

Recap: for loop syntax

```
for(int i = 0; i < 4; i++)
```

initialization	int i = 0;	Initialise a loop control variable (LCV) e.g. i. It can include a variable declaration.
boolean condition	i < 4;	Is a valid boolean condition that typically tests the loop control variable (LCV).
post-body action	i++	A change to the loop control variable (LCV). Contains an assignment statement.

Recap: for loop flowchart

for loop: for iterating over a collection (e.g. ArrayList)

```
/**  
 * List all notes in the notebook.  
 */  
  
public void listNotes()  
{  
    for(int i= 0; i < notes.size(); i++) {  
        System.out.println(notes.get(i));  
    }  
}
```

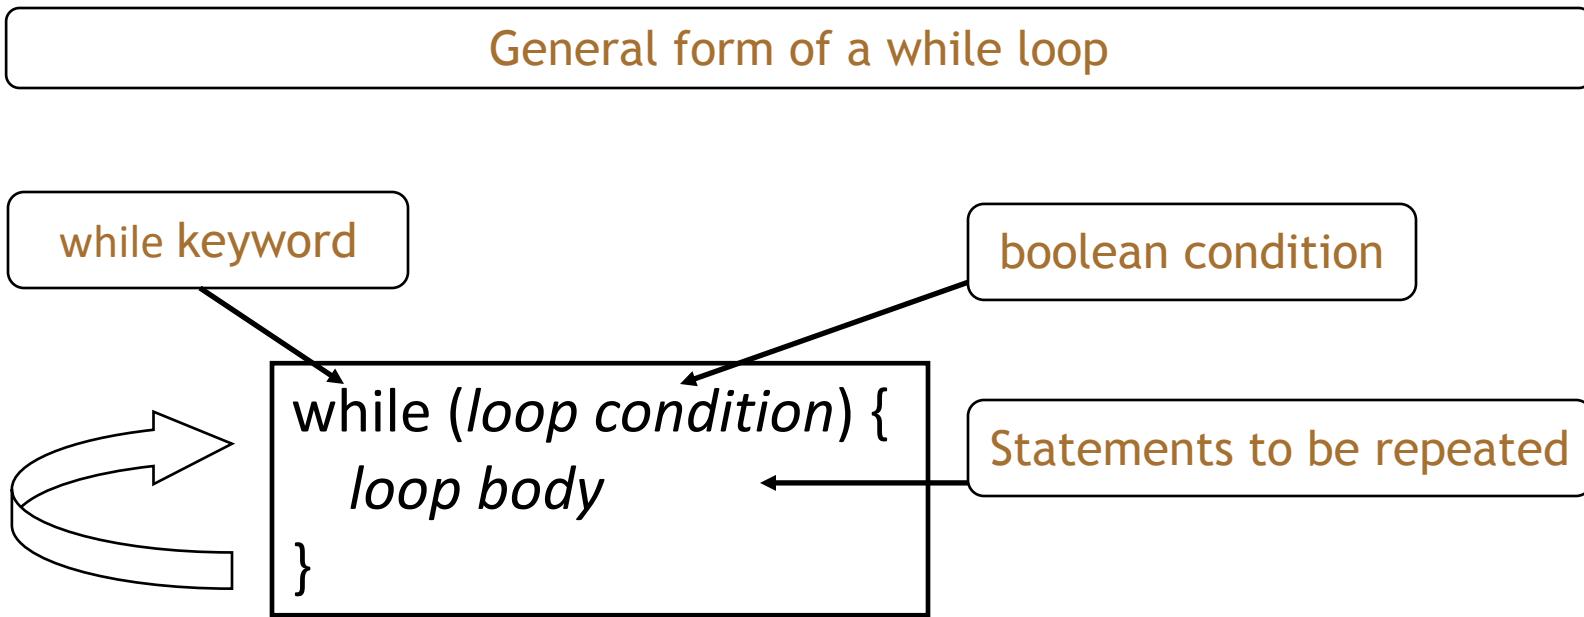

Increment
index by 1

for each value of *i* less than the size
of the collection,
print the next note,
and then increment *i*

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

Recap: while loop pseudo code

while we wish to continue, do the things in the loop body

Recap: while loop construction

Declare and initialise **loop control variable (LCV)**

while(condition based on LCV)

{

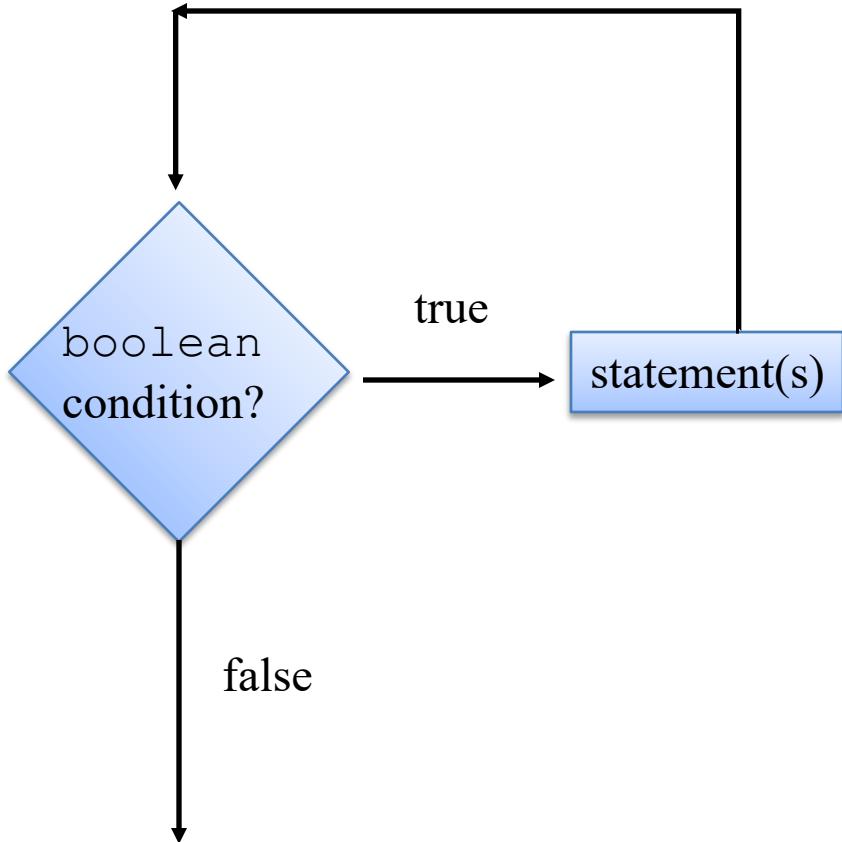

“do the job to be repeated”

“update the **LCV**”

}

This structure should always be used

Recap: while loop flowchart

```
int i = 1;  
while (i <= 10)  
{  
    System.out.println(i);  
    i++;  
}
```

while loop: iterating over a collection (e.g. ArrayList)

```
/**  
 * List all notes in the notebook.  
 */  
  
public void listNotes()  
{  
    int i = 0;  
    while(i < notes.size()) {  
        System.out.println(notes.get(i));  
        i++;  
    }  
}
```

while the value of *i* is less than the size of the collection,
print the next note,
and then increment *i*

Increment *i*
by 1

for versus while

```
/**  
 * List all notes in the notebook.  
 */  
  
public void listNotes()  
{  
    for(int i=0; i < notes.size(); i++) {  
        System.out.println(notes.get(i));  
    }  
}
```

```
/**  
 * List all notes in the notebook.  
 */  
  
public void listNotes()  
{  
    int i = 0;  
    while(i < notes.size()) {  
        System.out.println(notes.get(i));  
        i++;  
    }  
}
```

Variable **i** is the Loop Control Variable (**LCV**).

It must be initialised, tested and changed.

int i = 0 is the **initialisation**.

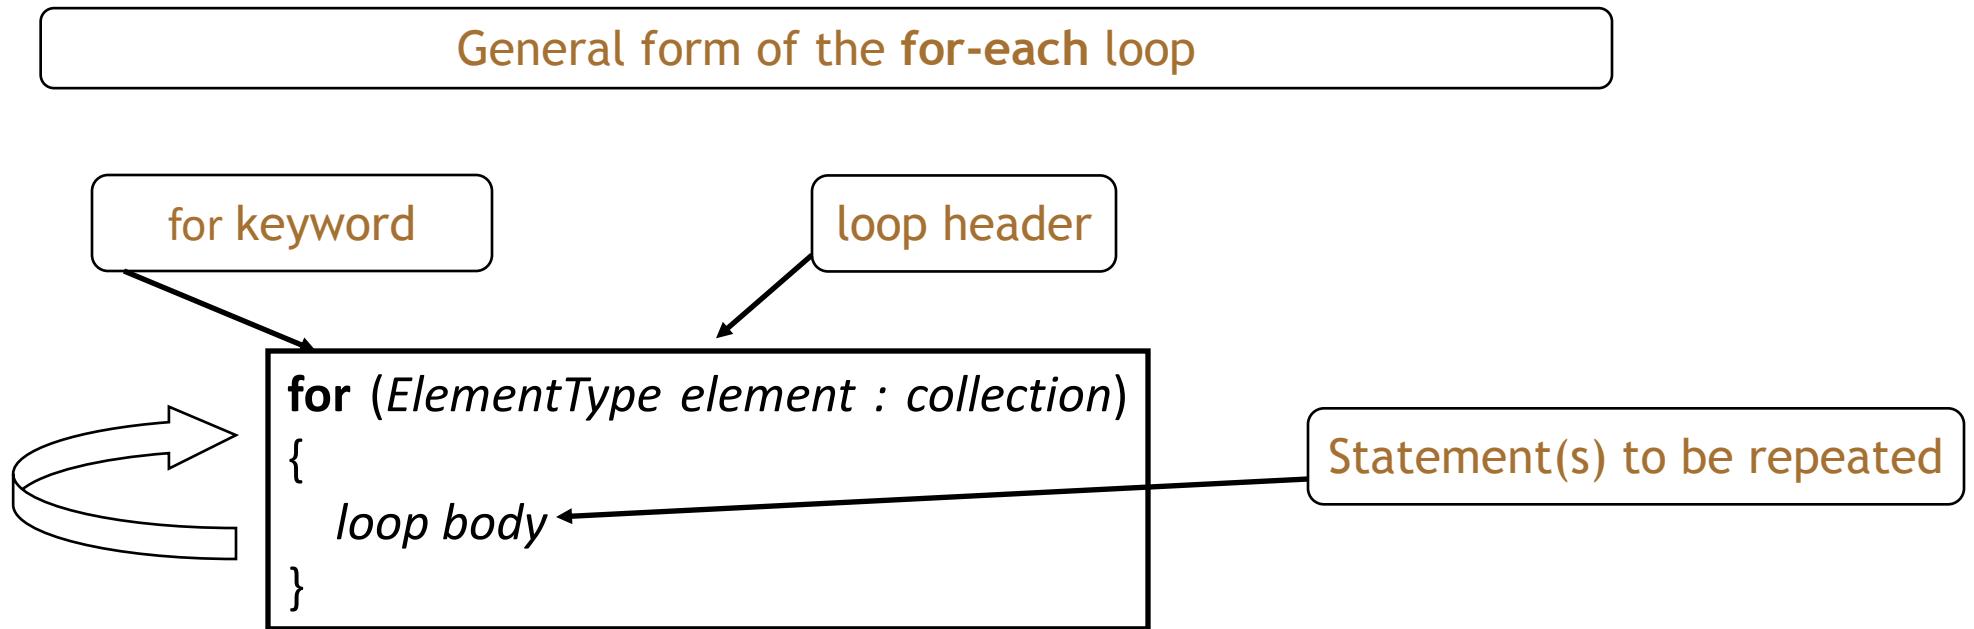

i < notes.size() is the **test**.

i++ is the post-body action i.e. the **change**.

Topic list

1. Grouping Objects
 - Developing a basic personal notebook project using **Collections**
e.g. **ArrayList**
 2. Indexing within Collections
 - Retrieval and removal of objects
 3. Generic classes
 - e.g. **ArrayList**
 4. Iteration
 - Using the **for** loop
 - Using the **while** loop
 - Using the **for each** loop 
- Next SlideDeck:
coding a Shop Project that stores an **ArrayList** of Products.

for each loop: pseudo code

For each *element* in *collection*, do the things in the *loop body*.

for each loop: iterating over a collection (e.g. ArrayList)

```
/**  
 * List all notes in the notebook.  
 */  
public void listNotes()  
{  
    for (String note : notes) {  
        System.out.println(note);  
    }  
}
```

for each *note* (of type *String*)
in the *notes* collection,
print out *note*

for each loop

- Can only be used for **access**;
 - you can't remove the retrieved elements.
- Can only loop forward in single steps.
- Cannot use to compare two collections.

for each **versus** while

- for-each:
 - easier to write.
 - safer: it is guaranteed to stop.
- while:
 - we **don't have** to process the whole collection.
 - doesn't even have to be used with a collection.
 - take care: could be an *infinite loop*.

ArrayList Collection

- We specify:
 - the **type of collection**
 - e.g.: **notes**
 - the **type of objects** it will contain
 - e.g.: **<String>**
- We say
 - “**notes** is an **ArrayList of String**”

Summary

- Java **Collections** Framework

- **ArrayList**

- import java.util.**ArrayList**;
 - private **ArrayList <String>** notes;
 - notes = **new ArrayList <String>()**;
 - notes.**add**(note);
 - notes.**size**();
 - notes.**get**(noteNumber)
 - notes.**remove**(noteNumber);

- **Iterating collections**

- **for each**

- for (String note : notes)
 {System.out.println(note);}
